

House of Energy

– your short cut to green growth

What is the purpose of House of Energy?

The cluster House of Energy believes that it is possible for the **green transition of the energy system and growth** to go hand in hand. Both when it comes to economy and jobs. The green transition is creating new opportunities for Danish companies – in Denmark and on the export markets. The cluster **House of Energy** wants to support this development. We are inviting every company and organization working with renewable energy, located in the northern part of Denmark and its nearby areas, to join us in the aim to attract capital, create new jobs, new export opportunities and new breakthroughs within research.

How do we boost green growth?

In House of Energy we have gathered Danish expertise within the **wind industry, district heating, green fuels and energy efficient solutions**. The cluster includes both manufactures and distributors of renewable energy. This also includes energy relating subcontractors – large and small, as well as established companies and startups. We believe in partnerships across size and technologies.

Small companies cannot hold all competences inhouse and they often need larger companies which can pave the way for them. Large companies also need the small companies, as they often cannot react fast enough on new opportunities in the market, and therefore need small companies which can contribute with agility.

We also believe in the **integration of different energy technologies**. When we are going to phase out fossil fuels it will be necessary for the technologies to work together to produce, store and use the energy. We are especially good at that in Denmark. However, we can be even better. House of Energy will ensure that the suppliers of various energy technologies will meet each other and identify where it is possible to enter into an agreement, create new projects and raise external co-funding.

Aalborg University has more than 400 researchers who are working with renewable energy. House of Energy bridges the gap between researchers and companies in such that the research results will be implemented in the production and distribution.

North Denmark EU-office is a partner in House of Energy. They assist companies and projects to identify where it is possible to get co-financing for activities and projects.

Which activities do we offer?

Today House of Energy has more than 400 members who use the cluster and each other to strengthen their business. This is facilitated by House of Energy through:

- **Networking events and conferences**
- **Visits from delegations from abroad**
- **Matchmaking**
- **Project development**
- **Knowledge sharing**
- **Visibility of competences across the cluster and in relation to existing stakeholders**

House of Energy is your **one-stop-shop** to competences and resources within the field of energy. The House of Energy cluster secretariat is made up of 15 experts who help the members to find the right business partners in Denmark and abroad, foster the right conditions for knowledge sharing and undertaking new projects. House of Energy has the competences to make your company visible to relevant collaborators in Denmark and abroad.

You can become part of the cluster by signing up for a membership. Read more at www.house-of-energy.dk/en

As a member of House of Energy, you are contributing to work for the UN Sustainable Development Goals
